

Abstract of the Disclosure

A device name data storing area and a measurement date-and-time data storing area are provided in a data file for storing measurement data. When measurement data are stored, the device name data and the measurement date-and-time data are also stored at the same time. A combination of the device name and the measurement date-and-time corresponds to only one measurement. Therefore, even if the file name and the measurement date-and-time contained in the data file are altered or falsified later, when the device name and the measurement date-and-time in the file are read, it can be easily determined whether at least the file is desired one or not.
